

House Price Prediction Knowledge Base

1. Project Overview

This project is a machine learning application for predicting house prices by area. The model analyzes historical data and relevant features to estimate prices. Currently, the model is experimental and may not be fully accurate, so predictions should be interpreted with caution.

2. Key Metrics and Indicators

- Average Price per Area: The mean house price in a specific region.
- Price Deviation: The standard deviation of house prices, indicating variability.
- Price Trends: Information about whether prices are generally increasing or decreasing over time.
- Other Indicators: May include median price, price per square meter, or market sentiment.

3. Common Customer Questions

Examples of questions users might ask:

- What is the average price in District 1?
- Are house prices going up in my area?
- Why is the predicted price so high/low?
- How reliable is the prediction?
- Can you explain the price deviation?

4. Explanations for Users

- Average Price: Gives a quick estimate of what houses typically cost in a region.
- Price Deviation: High deviation means prices vary a lot; low deviation means prices are stable.
- Price Trends: Upward trend indicates rising prices, downward trend indicates falling prices.
- Interpretation Tips: Consider location, house size, and other features when looking at predictions.

5. Usage Notes for Chatbot

This PDF is intended as a reference for the chatbot. It should read this content to answer user questions about the house price prediction project. If a question cannot be fully answered, the chatbot should ask for the user's email for follow-up and record the unknown question for future improvement.
